KALLIOPE**LAM**

KALLIOPE**LAM**

The secure, functional, and easy to use videoconferencing platform.

KalliopeLAM (LookAtMe) was designed to facilitate your business' operational continuity regardless of employees and customers, whether sitting at office workstations, in external locations, or their own homes. KalliopeLAM allows you to organize virtual meetings, just as they happen in actual meeting rooms.

KalliopeLAM is based on an open-source engine and entirely in the cloud, a web-based platform (click and go); meeting participants access the meeting via their web browser simply by clicking on the link contained in the invitation email.

Ease of configuration

Your virtual meeting room in a few simple steps. Users manage the KalliopeLAM platform, such as creating events or assigning permissions, fully integrated into the PBX web interface.
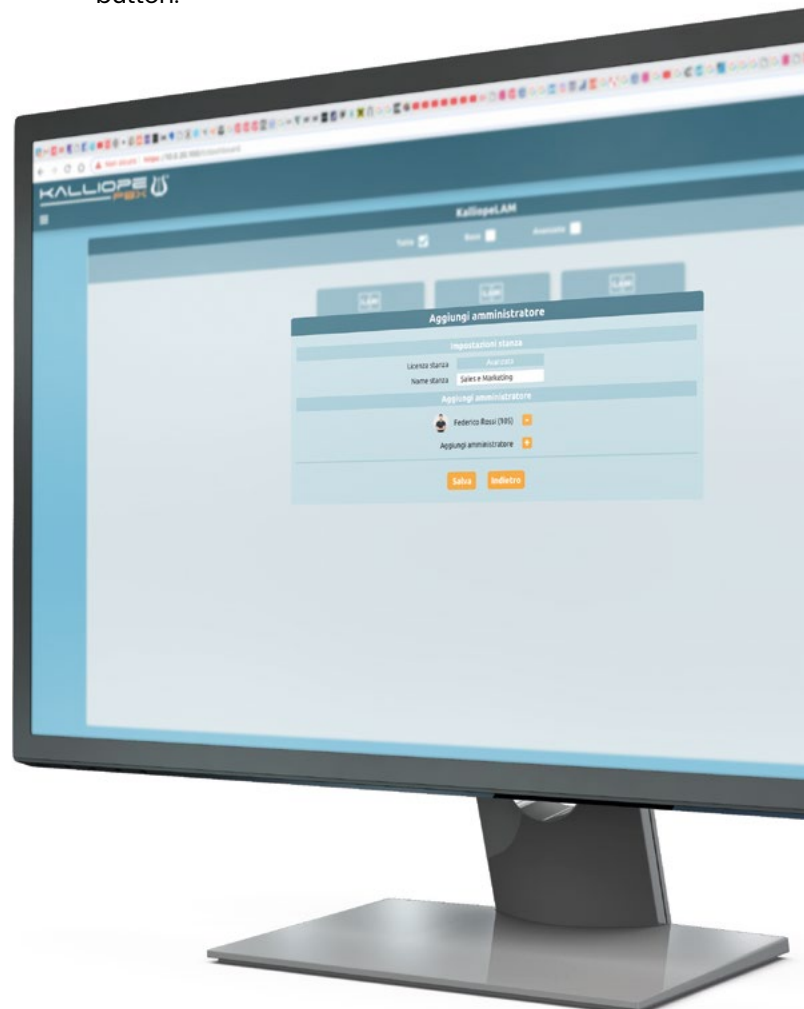

KalliopeLAM is not licensed for users, but for rooms, each license enables a videoconference room, an actual virtual meeting room that you can:

- **Assign a room name**

- **Define ownership of the room**, or assign its use to one or more users. There is a limit to the number of administrators per room, and they must have a PBX internal extension. The KalliopeLAM administrator controls virtual meeting rooms and can choose and assign rooms to one or more administrators. Each user has dedicated access and can manage and book a room as an actual meeting room.

The user can:

- Access the **"meeting schedules" calendar** of a particular room and choose to host a meeting.

- Create a new meeting by entering the following fields: meeting name, time, login password (optional), list of participants.

- Send invitations and calendars to all meeting participants by clicking on the **"Save and send"** button.

Main features

KalliopeLAM offers the following features:

- Videoconference web.
- Password protection of meetings.
- Waiting-room.
- Desktop sharing
- Chat
- Raise of hands
- Interlocutor statistics
- YouTube video sharing

Secure: Protect the privacy of your meetings

In the Kalliope system, security and privacy protection represent fundamental principles; for this reason, several mechanisms have been implemented to ensure privacy and security in your meetings on the KalliopeLAM platform.

- **New videoconference instances for each new meeting**

  The different instances will be valid only during the indicated booking period and from the beginning to the end of the meeting. These instances (represented in the meeting share URL) consist of 42 alphanumeric characters. In the case of an invitation as moderator, will be present at the end of the URL as an additional token of 493 characters.

- **Waiting room enabled by default**

  The moderator is notified that a guest has requested to enter and can decide to accept or not. The moderator can disable the waiting room meeting by meeting.

- **Password protection for access to meetings**

  The password can either be defined in the planning phase of the meeting or during the meeting itself.

- **If the moderator leaves the meeting, the guests are disconnected**

- **The moderator can elect other users as moderators**

KalliopeLAM is an accessory license that can be integrated with an existing and activated KalliopePBX switchboard, purchasable for a monthly fee with an annual renewable contract.

Not available for Kalliope V4 MINI.
Models enabled: Kalliope V4 Lite and higher, including VMs.

Minimum firmware version required 4.11.X or later.
